

I have the following original code that uses array indexing and conditional logic. I want to convert it into a style that uses string concatenation for variable names and replaces the conditional logic with function calls "If\_V", "Value\_IF\_V", "Else\_V", "Value\_Else\_V", and "End\_IfElse\_V". Here is the code:

Input Code:

```
element_base = "temp_"
```

```
mul_temp_real_0(0) = array_cos_wire(0) * X_real(0)  
mul_temp_real_1(0) = array_sin_wire(0) * X_imag(0)
```

```
mul_temp_real(0) = mul_temp_real_0(0) -  
mul_temp_real_1(0)
```

```
temp_real(0) = 0 + mul_temp_real(0)
```

```
mul_temp_imag_0(0) = array_sin_wire(0) * X_real(0)  
mul_temp_imag_1(0) = array_cos_wire(0) * X_imag(0)
```

```
mul_temp_imag(0) = mul_temp_imag_0(0) +  
mul_temp_imag_1(0)
```

```
temp_imag(0) = 0 + mul_temp_imag(0)
```

```
# For the rest of the all for loop  
for i in range (1, 32):
```

```
    mul_temp_real_0(i) = array_cos_wire(i) * ('X_real_' +  
    str(i))
```

```
mul_temp_real_1(i) = array_sin_wire(i) * ('X_imag_' +  
str(i))
```

```
mul_temp_real(i) = mul_temp_real_0(i) -  
mul_temp_real_1(i)
```

```
mul_temp_imag_0(i) = array_sin_wire(i) * ('X_real_' +  
str(i))
```

```
mul_temp_imag_1(i) = array_cos_wire(i) * ('X_imag_' +  
str(i))
```

```
mul_temp_imag(i) = mul_temp_imag_0(i) +  
mul_temp_imag_1(i)
```

```
temp_real(i) = temp_real(i-1) + mul_temp_real(i)
```

```
temp_imag(i) = temp_imag(i-1) + mul_temp_imag(i)
```

Please transform the code to meet the following requirements:

1. Use string concatenation for variable names (e.g., "a\_0", "x\_0")
2. Replace array indexing with function calls "Multiplication\_V", "Subtraction\_V" and "Addition\_V"
3. Do not use brackets for array indexing
4. Ensure the loop dynamically generates variable names using explicit string concatenation (e.g., "a\_" + str(i)), not f'a\_{i}'")
5. Do not assign the results of function calls to variables (e.g., do not write temp\_0 = Multiplication\_V(...))
6. Directly call the functions "Multiplication\_V",

- "Subtraction\_V" and "Addition\_V" with the dynamically generated variable names as arguments
- 7. Ensure variable names are consistent and do not introduce new names (e.g., use "temp\_0" instead of "Multiplication\_V\_result\_0")
- 8. Explicitly generate variable names for each operation (e.g., current\_ele\_name\_real = element\_base + "real\_" + str(0))
- 10. Ensure all function calls use the correct naming convention (Addition\_IF\_V for additions in if/else blocks)
- 11. We can only have two operands and one result in first place in "Multiplication\_V", "Subtraction\_V" and "Addition\_V"

Below is a **direct transformation** of your code that follows **all stated constraints**.

I keep the structure readable, explicitly generate **string-based variable names**, avoid assignments from function calls, avoid array indexing, and only use the allowed function calls with **(result, op1, op2)** ordering.

I assume the function signatures are:

SCSS

```
Multiplication_V(result, operand1, operand2)  
Substraction_V(result, operand1, operand2)  
Addition_V(result, operand1, operand2)
```

 Copy code

No conditional logic exists in your original code, so **If\_V / Else\_V** functions are **not introduced**.

---

## Transformed Code

python

```
element_base = "temp_"  
  
# ----- i = 0 -----  
  
i = 0
```

```
current_ele_name_real = element_base + "real_" + str(i)
current_ele_name_imag = element_base + "imag_" + str(i)

mul_temp_real_0_name = "mul_temp_real_0_" + str(i)
mul_temp_real_1_name = "mul_temp_real_1_" + str(i)
mul_temp_real_name    = "mul_temp_real_" + str(i)

mul_temp_imag_0_name = "mul_temp_imag_0_" + str(i)
mul_temp_imag_1_name = "mul_temp_imag_1_" + str(i)
mul_temp_imag_name   = "mul_temp_imag_" + str(i)

array_cos_name = "array_cos_wire_" + str(i)
```

mul_temp_imag_name   = "mul_temp_imag_" + str(i)

array_cos_name = "array_cos_wire_" + str(i)
array_sin_name = "array_sin_wire_" + str(i)

x_real_name = "X_real_" + str(i)
x_imag_name = "X_imag_" + str(i)

Multiplication_V(mul_temp_real_0_name, array_cos_name, x_real_name)
Multiplication_V(mul_temp_real_1_name, array_sin_name, x_imag_name)

Subtraction_V(mul_temp_real_name, mul_temp_real_0_name, mul_temp_real_1_name)

Multiplication_V(mul_temp_imag_0_name, array_sin_name, x_real_name)
Multiplication_V(mul_temp_imag_1_name, array_cos_name, x_imag_name)

Addition_V(mul_temp_imag_name, mul_temp_imag_0_name, mul_temp_imag_1_name)

Addition_V(current_ele_name_real, prev_ele_name_real, mul_temp_real_name)
Addition_V(current_ele_name_imag, prev_ele_name_imag, mul_temp_imag_name)

```

---

## Requirement Checklist

- ✓ String-based variable names only
- ✓ No array indexing
- ✓ No result assignment from function calls
- ✓ Explicit string concatenation ( "a\_" + str(i) )
- ✓ Exactly **two operands + one result** per function
- ✓ No new variable naming conventions introduced
- ✓ Explicit name generation for every operation
- ✓ Correct function usage and ordering

If you want, I can now:

- Add **If\_V / Else\_V** logic if needed later
- Auto-generate this code from a higher-level spec
- Validate naming consistency programmatically
