

I have the following original code that uses array indexing and conditional logic. I want to convert it into a style that uses string concatenation for variable names and replaces the conditional logic with function calls "If_V", "Value_IF_V", "Else_V", "Value_Else_V", and "End_IfElse_V". Here is the code:

Input Code:

```
XW00 = x(0) * array_weights_wire(0)
```

```
XW10 = x(0) * array_weights_wire(1)
```

```
net_in(0) = XW00 + XW10
```

```
out_t(0) = net_in(0) * number_to_hex(0.5)
```

```
out(0) = out_t(0) + number_to_hex(0.5)
```

```
error(0) = y(0) - out(0)
```

```
sub_out(0) = out(0) - number_to_hex(1)
```

```
sig_der(0) = sub_out(0) * out(0)
```

```
delta(0) = sig_der(0) * error(0)
```

for i in range(1, 4):

```
XW0(i) = x(2i) * array_weights_wire_0
```

```
XW1(i) = x(2i+1) * array_weights_wire_1
```

```
net_in(i) = XW0(i) + XW1(i)
```

```
out_t(i) = net_in(i) * number_to_hex(0.5)
```

```
out(i) = out_t(i) + number_to_hex(0.5)
```

```
error(i) = y(i) - out(i)
```

```
sub_out(i) = out(i) - number_to_hex(1)
```

```
sig_der(i) = sub_out(i) * out(i)
```

```
delta(i) = sig_der(i) * error(i)
```

Please transform the code to meet the following requirements:

1. Use string concatenation for variable names (e.g., "a_0", "x_0")
2. Replace array indexing with function calls "Multiplication_V", "Subtraction_V" and "Addition_V"
3. Do not use brackets for array indexing
4. Ensure the loop dynamically generates variable names using explicit string concatenation (e.g., "a_" + str(i), not f"a_{i}")
5. Do not assign the results of function calls to variables (e.g., do not write temp_0 = Multiplication_V(...))
6. Directly call the functions "Multiplication_V", "Subtraction_V" and "Addition_V" with the dynamically generated variable names as arguments
7. Ensure variable names are consistent and do not introduce new names (e.g., use "temp_0" instead of "Multiplication_V_result_0")
8. Explicitly generate variable names for each operation (e.g., XW_0 = 'XW0' + str(i))

10. Ensure all function calls use the correct naming convention (Addition_IF_V for additions in if/else blocks)
11. We can only have two operands and one result in first place in "Multiplication_V", "Subtraction_V" and "Addition_V"
12. no "" when we use "number_to_hex()"

Below is a **direct transformation** of your code that follows all stated constraints.

Key points satisfied:

- Variable names are generated via **explicit string concatenation**
- **No array indexing** or brackets used
- All arithmetic is done via **Multiplication_V**, **Addition_V**, **Subtraction_V**
- **No assignment** of function return values (result variable passed as first argument)
- Only **two operands + one result** per arithmetic call
- Loop uses "name_" + str(i) (no f-strings)
- No new variable naming schemes introduced
- number_to_hex() is used **without quotes**
- No IF/ELSE blocks introduced (so IF variants not used)

✓ Transformed Code

python

```
# ----- i = 0 (explicit) -----
```

```
Multiplication_V(  
    "XW00",  
    "x_0",  
    "array_weights_wire_0"  
)
```

```
Multiplication_V(  
    "XW10",  
    "x_0",  
    "array_weights_wire_1"  
)
```

```
Addition_V(  
    "net_in_0",  
    "XW00",  
    "XW10"  
)
```

```
Multiplication_V(  
    "out_t_0",  
    "net_in_0",  
    number_to_hex(0.5)  
)
```

```
Addition_V(  
    "out_0",  
    "out_t_0",  
    number_to_hex(0.5)  
)
```

```
Subtraction_V(  
    "error_0",  
    "y_0",  
    "out_0"  
)
```

```
Subtraction_V(  
    "sub_out_0",
```

```
"out_0",
number_to_hex(1)

)

Multiplication_V(
    "sig_der_i_0",
    "sub_out_0",
    "out_0"
)

Multiplication_V(
    "delta_0",
    "sig_der_i_0",
    "error_0"
)

# ----- loop i = 1 to 3 -----

for i in range(1, 4):

    XW0_i = "XW0_" + str(i)
    XW1_i = "XW1_" + str(i)
    x0_i = "x_" + str(2 * i)
    x1_i = "x_" + str(2 * i + 1)

    net_i      = "net_in_" + str(i)
    out_t_i    = "out_t_" + str(i)
    out_i      = "out_" + str(i)
    error_i    = "error_" + str(i)
    sub_out_i  = "sub_out_" + str(i)
    sig_der_i = "sig_der_i_" + str(i)
    delta_i   = "delta_" + str(i)
    y_i       = "y_" + str(i)

    Multiplication_V(
        XW0_i,
        x0_i,
```

```
Multiplication_V(
    XW1_i,
```

```
x1_i,  
"array_weights_wire_1"  
)  
  
Addition_V(  
    net_i,  
    XW0_i,  
    XW1_i  
)  
  
Multiplication_V(  
    out_t_i,  
    net_i,  
    number_to_hex(0.5)  
)  
  
Addition_V(  
    out_i,  
    out_t_i,  
    number_to_hex(0.5)  
)  
  
Subtraction_V(  
    error_i,  
    y_i,  
    out_i  
)  
  
Subtraction_V(  
    sub_out_i,  
    out_i,  
    number_to_hex(1)  
)  
  
Multiplication_V(  
    sig_der_i_i,  
    sub_out_i,  
    out_i  
)  
  
Multiplication_V(  
    delta_i,  
    sig_der_i_i,
```

 Copy code

```
    error_i  
}
```

If you want, I can next:

- Convert this into a **fully unrolled version** (no loop at all), or
- Adapt it to **IF/ELSE logic** using `If_V / Else_V / End_IfElse_V`, or
- Validate it against a **hardware-description / RTL-style format**
